

Arch Spin pt. 2 — Initial setup

First steps to rolling your own spin

I think I'm going to call it a spin . . . * Install the package `archiso` from the official repos or `archiso-git` from the AUR * `$ mkdir ~/<build-directory>`
* Replace `<build-directory>` with wherever you want the iso build to be stored. This is where we'll be spending all of our time configuring. Mine is at `~/liveiso/` and that's the path I'll be using in this and future posts
* `$ sudo cp -r /usr/share/archiso/configs/releng/ ~/liveiso` * Edit `~/liveiso/packages.x86_64` to install desired software * This will be addressed in the next post, `packages.x86_64`, where I also give some quick ways to install everything you might want.
